

2003 Compact Clothes Washer Energy Data (Data Based on Appendix J Test)

Data Based on 2003 Test Procedure ("Appendix J" Test)	Estimated Annual Operating Cost
<p>The energy data on this chart was submitted to the FTC in October 2003 and reflects the test procedure required by federal law at that time (the "Appendix J" test). On January 1, 2004, manufacturers were required to begin testing and labeling their clothes washers using a new test procedure (the "Appendix J1" test). The data below does not reflect the results of the new test procedure.</p>	<p>To obtain an estimated operating cost for a particular model, click on the "Cost per kWh" cell next to the desired model and choose an electricity cost figure which reflects the amount you pay for electricity. The national average cost for electricity is between 8 and 9 cents per kWh.</p>
What do the energy consumption numbers on this table mean?	Important Note About Operating Costs
<p>Energy consumption for these appliances is measured in kilowatt-hours (kWhs). The more energy an appliance consumes, the more it will cost to operate. One kilowatt-hour (kWh) is the amount of electrical energy supplied by one kilowatt over a one-hour period. It is the basic unit of measurement for electrical energy. Electricity bills are based in part on the number of kilowatt-hours a customer uses during a billing period. These consumption figures do not include the cost of water.</p>	<p>Your actual operating cost will vary depending on your utility rates and your use of the product. The estimated operating cost calculated here assumes the use of electricity to heat water. The use of other fuels for water heating will yield different estimated costs.</p>
